

Conference Core Stack

CoDaWork 2026 — Coimbra, Portugal | Peter Higgins | Rogue Wave Audio
Material triage: what leads, what follows, what stays home.

FRONT ROOM — First Contact Material

- 1. The Scientific Claim (spearpoint).** The third diagnostic — the coherence residual — makes subcompositional coherence empirically measurable in compositional time series. Computed on EMBER: strict coherence does not hold (mean CR ~0.58). 31% of transitions show invisible structural change that TV and Aitchison distance classify as stable. Cross-validated on Backblaze (different physics, same mathematics, same pattern families).
- 2. The Conference Framing.** "I am presenting a calibration study for compositional monitoring in time series — not a finished framework. I am asking where it breaks, where it overlaps prior art, and what would be required to make it mathematically sound."
- 3. The Three Diagnostics.** Total variation distance (raw proportions). Aitchison distance (log-ratio coordinates). Coherence residual (cross-branch coupling in SBP decomposition). Do not fuse — compare. Disagreement is diagnostic signal.
- 4. The Cases.** Lead with EMBER (energy, 9 carriers, 3 countries, 25 years). Backblaze as credibility sentence: same instrument on hardware reliability data (900,000+ drives, 4 manufacturers). Different domain, same patterns.
- 5. The Ask.** Not adoption. Help with: formalising the coherence residual, calibrating thresholds, checking diagnostic independence, stress-testing SBP sensitivity, and determining whether the coherence framing is fair to CoDa theory.

SECOND ROOM — After Interest Is Established

- Compositional Governance Scale (CGS).** Five governance-gated levels. $CGS = \log_{10}(GDoF)$. Current state: (CGS-2, n=3). Appendix material — shows where the instrument is going, not where it is. Do not lead with this.
- 25-Error Calibration Catalogue.** E-01 through E-17 (active) + E-18/E-19 (future) + ES-01 through ES-06 (scaling). Each has detection test and governance action. First failure-mode catalogue for a CoDa monitoring instrument. The credibility anchor.
- Ramsar Complexity Gap.** 172 countries, 2,500 wetlands, species compositions as carriers on the simplex. The ecological deployment path. Discuss only if ecologists are in the room.
- The Analyzer (Demonstrator).** Open-loop, stateless, observational. Produces audit trail of events. Behaves as lab instrument, not command system. Show if asked.

OFF TABLE — Not for First Coimbra Contact

Peterson outreach (philosophy lane, separate from conference lane). Planetary voltage / Kardashev framing. Internal governance documents. HUF-CLS commercial licensing. Anything that sounds prophetic or planetary before the science is accepted.

THREE ALIGNMENT SENTENCES

Every conference-facing artifact (abstract, packet, presentation, union memo, analyzer) must say the same three things:

1.	This is a calibration study of a compositional monitoring instrument, not a finished framework.
2.	The instrument uses three diagnostics: total variation distance, Aitchison distance, and the coherence residual.
3.	A 25-error calibration catalogue with detection tests and governance actions makes the instrument falsifiable.
